

RideLink Account Service

Postman URL Check Report

IT3130 - Application Development | Account Service
Owner: Fernando B S C | Student ID: IT24103775
Check date: 30 September 2026 | Environment: Local

Overall result	BLOCKED - SERVICE OFFLINE
Base URL	http://localhost:8081
Postman requests reviewed	20
Unique API endpoints	6
Live TCP check	Port 8081 closed

Executive conclusion

The Account Service URL definitions are consistent across the Spring controllers, application configuration, and the dedicated Postman collection. However, no live HTTP result can be marked PASS on this check date because nothing is listening on localhost port 8081. This is an environment/startup blocker, not evidence that the routes are incorrect.

Evidence boundary

A TCP connection attempt and GET request to /v3/api-docs failed because the service was offline. Newman is not installed, and Maven is not available in the current shell. Therefore, this report does not invent response times, response bodies, or passing runtime assertions.

1. URL inventory and expected checks

Method	URL	Access	Expected	Status
GET	/swagger-ui/index.html	Public	200 HTML	BLOCKED
GET	/v3/api-docs	Public	200 OpenAPI JSON	BLOCKED
POST	/api/auth/register/passenger	Public	201 / 400 / 409	BLOCKED
POST	/api/auth/register/driver	Public	201 / 400 / 409	BLOCKED
POST	/api/auth/login	Public	200 / 401 / 403	BLOCKED
GET	/api/accounts/{id}	Owner/Admin JWT	200 / 401 / 403 / 404	BLOCKED
PUT	/api/accounts/{id}	Owner/Admin JWT	200 / 400 / 401 / 403	BLOCKED
PATCH	/api/accounts/{id}/status	Admin JWT	200 / 400 / 401 / 403 / 404	BLOCKED

Base URL variable

The dedicated environment defines **account_service_url = http://localhost:8081**. All requests use this variable, avoiding hard-coded duplicate host values.

Route verification

The six Account API operations are declared by AuthController and AccountController. Swagger/OpenAPI paths and port 8081 are configured in application.yml. The Postman collection uses the same paths.

Current live result

Every URL is currently classified BLOCKED because the base host is unavailable. Endpoint-specific HTTP assertions cannot execute until the Spring Boot process starts and connects to MongoDB.

2. Postman collection coverage

Category	Count	Description
Health / Swagger	2	Swagger UI and OpenAPI document
Passenger registration	2	Success and duplicate email
Driver registration	2	Success and duplicate email
Login	3	Passenger, driver, wrong password
Account profile	3	Read, update, owner isolation
Account status	1	Admin-only transition; token required
Authentication negatives	2	Missing and invalid JWT
Authorization / RBAC	2	Passenger and driver forbidden
Validation	2	Invalid fields and malformed JSON
Security	1	Restricted-field update attack

3. Check results

C-01	Collection JSON parses	PASS	20 requests discovered in 10 folders.
C-02	Environment JSON parses	PASS	Base URL and token/ID variables are present.
C-03	Collection/controller URL match	PASS	Six API operations align with controller mappings.
C-04	OpenAPI/Swagger URL config	PASS	Paths align with application.yml and collection.
C-05	TCP localhost:8081	BLOCKED	Connection refused; service is not running.
C-06	GET /v3/api-docs	BLOCKED	No HTTP response because host is unavailable.
C-07	Full Postman run	BLOCKED	Requires running service; Newman is unavailable.
C-08	Maven verification today	BLOCKED	mvn command is unavailable in this shell.
C-09	Admin status happy path	BLOCKED	Requires a legitimately provisioned admin token.

Interpretation

Four static URL/configuration checks pass. Five runtime-dependent checks remain blocked. A blocked item must not be presented as a failed endpoint: it means the required local service or credential was unavailable.

4. How to obtain final live PASS/FAIL evidence

1. Set MONGODB_URI and a JWT_SECRET of at least 32 bytes in the local terminal. Do not commit either value.
2. Start Account Service on port 8081.
3. Import the dedicated collection and local environment listed below.
4. Select the local environment and run folders 01 through 10 in order.
5. Supply admin_token only through an approved admin bootstrap process; otherwise retain that check as BLOCKED.
6. Export the Postman run summary and update this report with actual assertion totals, statuses, and response times.

Collection: postman/RideLink_Account_Service.postman_collection.json

Environment: postman/RideLink_Account_Service_Local.postman_environment.json

5. Acceptance checklist

- [] Swagger UI and OpenAPI JSON return HTTP 200.
- [] Passenger and driver registration return 201 and save generated IDs.
- [] Duplicate normalized email returns 409.
- [] Passenger and driver login return 200 and save separate JWTs.
- [] Wrong password returns 401.
- [] Own profile read/update return 200 without passwordHash.
- [] Cross-account profile access returns 403.
- [] Missing or invalid JWT returns 401.
- [] Passenger and driver status changes return 403.
- [] Invalid registration and malformed JSON return 400.
- [] Restricted role/status/hash fields cannot be mass-assigned.
- [] Admin status transition is tested only with a legitimate admin token.

6. Final status

BLOCKED - SERVICE OFFLINE

The Postman URLs are correctly defined and internally consistent. The report is ready for a live rerun, but a runtime PASS claim requires the Account Service to be running with MongoDB and JWT configuration. Until then, retain the current status and do not substitute expected responses for observed responses.

Files inspected

Account controllers; application.yml; dedicated Account Service Postman collection; dedicated local Postman environment. No secrets, bearer tokens, database credentials, or password hashes are included in this report.
